PROFESSIONAL SUMMARY

Engineering professional experienced in electronics manufacturing, hardware validation, failure analysis, technical documentation, technician support, and cross-functional process improvement. Supports systems from prototype assembly through board bring-up, rework, test, and production readiness while developing structured workflows that improve traceability, repeatability, and communication between engineering and operations.

CORE COMPETENCIES

Manufacturing & Test: PCB assembly/rework, SMT, reflow, visual inspection, board bring-up, functional testing, verification, failure analysis, root-cause troubleshooting, production support

Instrumentation: Oscilloscope, VNA, DMM, bench power supply, microscope, LabVIEW, NI-VISA, SCPI, voltage-rail and waveform analysis

Systems & Operations: Requirements, process mapping, workflow design, BOM normalization, hardware traceability, assembly/rework/test procedures, technician training, cross-functional coordination

Automation & Platforms: Python, FastAPI, React/Vite, REST APIs, JSON, Git/GitHub, PartsBox, Mouser, Digi-Key, PostgreSQL architecture, Azure integration planning

ENGINEERING EXPERIENCE

Yank Technologies, Inc.

Brooklyn, NY

Electronics Technician - Manufacturing, Test & Engineering Support

Feb 2026-Present

- Support full-lifecycle development, debugging, manufacturing, testing, documentation, and verification of wireless power and communication systems.
- Perform PCB assembly, rework, board bring-up, and structured failure analysis using schematics, DMMs, bench supplies, oscilloscopes, VNAs, and controlled circuit isolation.
- Develop assembly procedures, rework instructions, inspection checklists, pre-power and power-up checks, functional-test records, and hardware traceability documentation.
- Coordinate manufacturing priorities and technician execution while translating engineering changes and test findings into clear production actions.
- Investigate recurring hardware and process failures, implement corrective actions, and standardize workflows to improve repeatability and reduce dependence on tribal knowledge.
- Develop early LabVIEW/NI-VISA/SCPI control workflows for programmable equipment, response validation, output-state checks, and communication-timeout troubleshooting.

ENGINEERING AUTOMATION & SYSTEMS PROJECT

AutoBOM - Internal Engineering Workflow Platform | Product Owner & System Architect

- Defined a traceable cross-functional platform connecting design, production, purchasing, and inventory; authored requirements, permissions, state models, audit rules, exception loops, and supplier-integration responsibilities.
- Led a local Phase 0 FastAPI/React-Vite implementation and the original Python/pandas BOM-cleaning prototype, including normalization, quantity scaling, overage logic, and component workflow concepts.
- Directed phased architecture for PostgreSQL, Azure AD, Microsoft Graph, Docker, CI/CD, and supplier APIs while reviewing system designs for usability, accessibility, and operational completeness.

New York City College of Technology, CUNY

Brooklyn, NY

College Lab Technician - Computer Engineering Technology

June 2023-Present

- Maintain technical lab readiness, troubleshoot embedded/electronics equipment, document repairs, and support students using test equipment and development platforms.

EDUCATION

New York City College of Technology, CUNY

Brooklyn, NY

Bachelor of Technology, Computer Engineering Technology - Magna Cum Laude

May 2025

Associate in Applied Science, Electromechanical Engineering Technology

June 2023
